Welcome to the Fast Lane With New LTE Product Line

CRN Wireless releases new LTE product line up. As with other CRN communicators, the LTE models are universally compatible with virtually all manufacturers regardless of model or age of equipment. Look no further than CRN Wireless for the most advanced long lasting network capabilities for your customers monitoring needs.

The new LTE communicator offers the industry Long-Term Evolution (“LTE”) product, operating on LTE wireless spectrum, which provides increased capacity and speed of wireless data through advanced digital signal processing techniques and modulations.

“At CRN Wireless, we continuously innovate to support the needs of our customers and help them succeed,” said Tony Saunders, Senior Vice President. “In addition to sunset-free UHF communicators that we have offered for over 30 years, the new LTE cellular line provides our customers with yet another network option.”

With the introduction of LTE, CRN Wireless expands its product offering of wireless communicators to include the most options available in the industry, ranging from cellular products that include 2G, 3G, 4G and LTE technologies across multiple carriers, to sunset-free UHF products.

LTE devices are now available for purchase through distributors or directly from CRN Wireless.

Generator Monitoring Be Prepared for Big Storms

After major storms such as hurricanes Harvey and Irma, generator manufacturers, dealers and service companies are often swamped with phone calls from generator owners who are upset that their generator failed to provide critical power during a utility outage. The callers are usually frustrated, and desperate to get power back in their homes and businesses. Often the generator hasn't exercised in months, requires maintenance or is faulted out. On the Monday following Hurricane Irma, one major generator manufacturer received about 50,000 phone calls on its consumer hotline — six times more than usual.

CRN Wireless Generator Monitoring can help prevent these types of failures, which will increase customer satisfaction, and your revenues. The CRN Generator Monitor provides real time notifications of critical events such as Run & Stop, Faults, Failure to Exercise, Maintenance Alerts, plus much more. All sent right to your cell phone and email, giving you and your customers confidence and peace of mind. Build your recurring revenue, while also providing a valuable service your customers will appreciate.

Alarm Communications Verizon Accelerating 'Copper Retirement' in Seven States

In 2017, Verizon has made 33 separate notifications to the FCC ("Copper Retirement Network Change Notifications"), indicating their intent to eliminate copper landline service in dozens of communities throughout seven New England and Mid-Atlantic states.

The affected states are Delaware, Maryland, Massachusetts, New Jersey, New York, Pennsylvania and Rhode Island. As we've reported in this newsletter previously, Verizon is not seeking FCC permission to retire these copper networks (which is not required since FCC rules were changed last year), but simply informing the FCC of their intent to eliminate the copper networks. The retirement dates range from February 28, 2018 to August 23, 2018.

By switching your alarm systems to secure wireless communicators from CRN Wireless, you'll eliminate the problems which plague wired landlines, and increase both subscriber security, and your RMR. CRN offers CDMA, GSM and LTE Cellular Communicators, and proprietary UHF Radio Communicators.
